

Student Guide — Lesson 1: What Is AI?

Hi coder!  Today we are NOT writing code. Instead, we are learning how computers can **learn** — kind of like you do!

What you'll learn

- What "AI" means (Artificial Intelligence)
- How a computer learns from examples instead of rules
- The 5 steps: **Examples** → **Training** → **Model** → **Prediction** → **Action**

The Big Idea

You already know a cat from a dog because you've SEEN lots of cats and dogs before. Nobody gave you a rule book. AI computers learn the exact same way — by looking at LOTS of examples until they spot patterns.

Try it yourself

1. Look at the picture cards your teacher gives you.
2. Sort them into two piles.
3. Say out loud: "I think this pile is ___ because ___."
4. Try to guess a brand-new card using your pattern — that's just like a computer making a **prediction** !

New words you learned

- **AI (Artificial Intelligence):** a computer program that can learn from examples.
- **Training:** showing the computer lots of examples so it can find patterns.
- **Model:** the "pattern brain" the computer builds after training.
- **Prediction:** the computer's smart guess about something new.

 Robot Tip: I'm not magic, I just study a LOT of examples!

Remember from Course 10 & 11

You already taught the computer exact RULES with code (like "if you touch the edge, bounce"). Today you learned that AI teaches the computer using EXAMPLES instead of exact rules!
