

Course 11 — Python for Young Builders

Ages 6–11 · 8 Lessons · 3 Portfolio Projects

The bridge from visual to text-based coding. Your child writes their first Python programs — variables, loops, and their very own mini projects. Taught slowly, with patience, and lots of fun.

Why It Matters

Moving from visual blocks to typed code is a big milestone. This course makes that jump gently, showing students that the logic they already know from Scratch works exactly the same way in real, professional code.

Lesson Breakdown

1. From Scratch blocks to Python text
2. Variables and user input
3. Printing and string formatting
4. If/else decisions
5. While loops and for loops
6. Lists and simple data
7. Building a mini quiz app
8. Final project: our own mini game

Portfolio Projects

1. **Personal Quiz App** ([personal_quiz_app.py](#)) — asks the player's name and several real questions, tracks score with a variable, gives a friendly tiered final message.
2. **Simple Calculator** ([simple_calculator.py](#)) — real +, −, ×, ÷ calculations, friendly division-by-zero handling, loops for repeated use.
3. **Word Guessing Game** ([word_guessing_game.py](#)) — a real `random` -module + list-based guessing game with limited attempts and win/lose messages.

Every project is a real, runnable `.py` file — each was actually executed with simulated input to confirm it works, and the real transcript is in its README.
